

Cloud Computing 101

In cloud computing, the word "cloud" is as a metaphor for "the Internet," so the phrase cloud computing is used to mean a type of Internet-based computing, where different services -- such as servers, storage and applications such as phone service or email -- are delivered to an organization's computers, tables or Smartphone through the Internet.

For a small or medium size business, where there is often a lack of time and financial resources to purchase, deploy and maintain an infrastructure (e.g. the software, server and storage) cloud computing offer immediate tangible benefits.

In cloud computing, businesses can access IT resources and expand or shrink services as needs change. The pay-as-you-go subscription model virtually removes the need for capital expenditure and is designed to let the customer easily add or remove services only paying for what you use.

Cloud computing has started to obtain mass appeal enabling computing resources to be accessed and shared as virtual resources in a secure and scalable manner.

Triton resells the cloud computing services of the nation's most respected carriers at highly competitive rates. We recommend best of breed products based on the type of service, diversity, price and geographic redundancy. Then we provide one point of contact to manage those services on an ongoing basis.
